

Pseudocódigo Fibonacci

Programación Dinámica

Memorización (recomendada)

```
int fibonaccimemo (int n) {  
    if (n <= 1) return n // Caso base  
    else {  
        // Calcula n1 y n2  
        int n1 = fibonaccimemo (n-1)  
        int n2 = fibonaccimemo (n-2)  
        // Suma  
        int f = n1 + n2  
        // Intercambia valores  
        n1 = n2  
        n2 = f  
    }  
}
```

Tabulación (iterativa)

```
int fibonacciterativo (int n) {  
    if (n <= 1) return n  
    else {  
        int n1 = 0  
        int n2 = 1  
        int f = 0  
  
        for (int i = 2; i <= n; i++) {  
            f = n1 + n2  
            n1 = n2  
            n2 = f  
        }  
        return f  
    }  
}
```
